

Macro organization and some small "tricks"

Suggestions previously described in "organization" they are also valid in case you decide to go out for some macrophotograph

You have to inform about a place where you think to go; normally, for this type of pictures you will go for woods, mountains, rivers.

The first suggestion is to foresee the eventuality to have to face some "difficult" circumstances. If you are in zones that you don't know, you have to inform about where are found all countries of the district where you will go and every sanitary offices (hospitals, ambulatory, pharmacy)...they

are important informations because..., going for woods in fact you can have a meetings not so pleasant... as snakes. In case of accidents (bites and poisonous punctures) it is fundamental to know where is the nearest hospital.

Fig. 1: it is important to inform about medical office presence

They are only caution rules; I believe that you will obviously have gone around for woods without all these matters.

You have to inform about street type, excavated, or asphalted one etc. In this

case it will be necessary to wear resistant clothes. This kinds of clothes are easily found in the open market where you can found some resistant clothes as military one; this kind of clothing is fortunately very trendy nowadays ...

But we are going to talk about a series of small equipments that belong to "work tricks".

Besides an usual equipment you have to add a small bottle of water (it won't needs you to drink), a small atomizer, a metal tweezers of about 20 cms., a trimmer and scissors, a piece of aluminum paper and a white cardboard, a little box (as that of films box) with honey diluted with water.

Fig. 2: a material to be inseterted in your bag for "macro" going out

How can be used these things ?

We start from water and **atomizer**...

Surely all you will have seen those beautiful photos, in which spider cloth was cover of water droplets in the early morning... if you want to take this kind of picture you have two alternatives, or to go in woods or country at 6 in the early morning, hoping that your spider cloth or your flower are in an accessible position and that light is correct, or....

or instead you can use your atomizer full of water to sprinkle fantastic dewy drops also at midday. Obviously we can use atomizer in any cases in which we want to realize dew or wet effect.

Fig. 3: dewy drops on a grass thread... they are realized using an atomizer

We will to speak now about a **tweezers**...

It is a simple tweezers... like that used for eyelashes.... in some cases makes it will be necessary to move a bug, in a brighter position , or to move a flower stamens in short tweezers will surely be usefull "to handle" your picture subject. Try to do not touch, bugs with hands and, when you will "handle them " with tweezers, pay attention...as they are fragile.

Fig. 4: using a tweezers it is possible to also disclose flower petals

Paperknife and scissors...

It happens very often that "subject" are placed in a not accessible position ...as a brushwood, or in dried shrub...so that in all those cases you can use paperknife and scissors without making damage a thread grass.
